TRANSIC100LP
LASER OXYGEN TRANSMITTER
The good nose for oxygen

Gas transmitter
Process parameters are best measured where they are relevant and present in an unaltered state – directly in the process. "In-situ measuring technology" or "Inline measuring" are the phrases used. The process parameters are determined under process conditions.

**Simple**

The TRANSIC100LP is an oxygen transmitter that measures in-situ or "inline". The sensor is designed as a measuring probe. This ensures that the lens system in the transmitter is always optimally aligned and installation is very simple. The measuring task can be implemented with little need for additional technical aids. Costly sampling and gas conditioning can be omitted in many cases.

**Consistent**

The TRANSIC100LP is the consistent implementation of a gas analyzer in the form of a field device: it combines the advantages of oxygen laser spectroscopy with the easy handling of a transmitter. Its transmitter design offers the following:

- Very easy to install
- Uncomplicated transmitter configuration
- Security with password protection for configuration level
- Clear connection concept

**Fast**

For the operation of the system it is decisive to always have the relevant process parameters in view. Direct measurement in the process is characterized by an extremely low response time. When the flow reaches the sensor of the TRANSIC100LP, the measured value is displayed without any significant delay.

**Low maintenance**

The TRANSIC100LP is based on the measurement principle of Tunable Diode Laser Spectroscopy (TDLS) and is a purely optical sensor. The TRANSIC100LP measures a natural characteristic of the oxygen directly independent of location and time. The measurement is virtually free of temporary drift. The gas transmitter has no mechanical components and is wear-free. Omitting sampling and gas conditioning means no operating or maintenance costs occur. SICK recommends calibration intervals of 12 months. Measurement runs at all times without using any consumables.
With exact laser technology

The TDLS Tunable Diode Laser Spectroscopy is primarily used in high-end gas analyzers and is characterized by its highly selective measurement capability. The oxygen properties are used for O₂ measurement: That means O₂ atoms in the near infrared range are stimulated at specific wavelengths. A laser diode modulates the radiation precisely over an absorption peak. The high-energy radiation transfers energy to the O₂ atoms and the signals becomes weaker. In the measuring probe, the laser beam hits the O₂ atoms and is weakened according to the concentrations of oxygen present there. A receiver measures the intensity of the arriving radiation and accurately determines the absorption. One distinct advantage of laser spectroscopy is its insensitivity to possible interference. For O₂ in particular, there is no absorption of other gases in the range of sampled absorption peaks.

Extended application area

The sensor optics can become contaminated in certain processes. Two filters are available to prevent this happening: a stainless steel filter to protect against soiling, and a PTFE filter for use in processes in which smaller particles or droplets can occur. If the process does not permit direct in-situ/inline measurement due to an increased pressure or temperature range, a sample gas cell provides a simple way to implement an extractive installation.
An explosion can only occur when all three elements (fuel, an ignition source and oxidant), referred to as the explosion triangle, are present. The primary explosion protection prevents the simultaneous occurrence of a fuel and an oxidant. If flammable substances cannot be avoided, no oxidants may be present.

The secondary explosion protection describes how to avoid ignition sources. Various applicable laws, standards and regulations have become established throughout the world. For example the European Directive 94/9/EC (European Commission, 1994) for devices and 1999/92/EC (European Commission, 1999) for operation (ATEX Directive) and the harmonized standards, or NEC 500 and NEC 505 in the USA.

For use in potentially explosive atmospheres, one version of the TRANSIC100LP approved by the Factory Mutual (FM) and one approved according to IECEX/ATEX are available.

Product description
Measuring the oxygen in the process can be quite simple. The TRANSIC100LP from SICK is the rugged transmitter that uses Tunable Diode Laser Spectroscopy (TDLS) to measure O₂ reliably. A technology more common in the world of high-tech analysis, is now being used in a field instrument: at an attractive price, easy installation, a long life, low maintenance and suitable for use in potentially explosive atmospheres.

At a glance
- O₂ transmitter based on high-performance laser spectroscopy (TDLS)
- For use in potentially explosive atmospheres (FM, ATEX and IECEX approvals)
- Measurement directly in-situ or extractive using a sample gas cell (option)

Your benefits
- Measures in real-time directly in the process
- Easy installation and operation
- Self-diagnostics with maintenance display
- Low requirements for gas conditioning
- Designed for heavy-duty industrial applications
- Compact design and easy to operate
- Long-term stability
- No moving parts
- Low operating costs: no consumables and no purging gas consumption
- Rugged: reliable measurement even in contaminated gases

Fields of application

- Monitoring of inert gas blanketing in tanks and vessels
- \( \text{O}_2 \) measurement in process gases
- Measurements in potentially explosive atmospheres
- Process monitoring in fermenters and bioreactors
- Room air monitoring
- Quality monitoring for the production of technical gases
- Replacement of extractive paramagnetic oxygen analyzers and electrochemical cells

Detailed technical data

The exact device specifications and performance data of the product may deviate from the information provided here, and depend on the application in which the product is being used and the relevant customer specifications.

### Calibration

- **1** ISO 9001 compliant factory calibration

### Maintenance and repair

- **A** Standard maintenance and repair
[1] With certificate for oxygen service
[2] For use in clean gas only or with a sample cell
[3] Not selectable for the O₂ measuring range 0 ... 100 vol.-%. Not recommended for wet gas near dew point.
[4] Can be reconfigured in the field
[5] Factory setting: 0 ... 25 vol-% O₂
[6] Can be reconfigured in the field (requires a serial interface and a terminal program on PC)
[7] Selectable only for the output range of 4 ... 20 mA
[8] Factory setting: 10 vol-% O₂
[9] PTFE filter for reference gas inlet recommended

TRANSIC121LP

Version

A With flange for in-situ installation, < 0.5 bar, O₂ measuring range of 0 ... 25 vol.-%
B With wall bracket for ambient air measurement, O₂ measuring range 2 ... 25 vol.-%
C With sample cell and wall bracket, PN10, O₂ measuring range 0 ... 25 vol.-%
F With flange for in-situ installation, PN10, O₂ measuring range of 0 ... 25 vol.-%
G With weld-on nozzle for in-situ installation, PN10, O₂ measuring range 0 ... 25 vol.-%
H With 3” clamp connection for in-situ installation, PN10, O₂ measuring range 0 ... 25 vol.-%

Filter type

1 No filter [1]
2 Stainless steel mesh filter
3 PTFE filter with stainless steel mesh [2]

Analog output range [3]

A Output range 0 ... 5 vol.-%
B Output range 0 ... 10 vol.-%
C Output range 0 ... 15 vol.-%
D Output range 0 ... 20 vol.-%
E Output range 0 ... 25 vol.-%
X Output range from _____ vol.-% to _____ vol.-% [4]

Analog output [5]

F 1 4 ... 20 mA
G 2 10 ... 20 mA

Fault state for analog output [5]

A ≤ 3 mA [6]
B ≥ 21 mA

Digital output [3]

1 Digital output opens ONLY in case of fault state
2 Digital output opens, if O₂ value undercuts the preset value of _____ vol.-% [7]
3 Digital output opens, if O₂ value exceeds the preset value of _____ vol.-% [7]
4 Digital output opens to indicate maintenance request

Cable bushing

A Cable gland Ex M20 x 1.5 for cable Ø 8 ... 11 mm [8]
B Conduit fitting NPT 1/2” for inner threads

Reference gas inlet

A No reference gas inlet
B Reference gas inlet with check valve [9]

Language operation instructions

B English

Approval

1 FM (USA, Canada)
A Material O-ring-set
B FFKM (Kalrez®)
C FFKM (BAM approved)

[1] For use in clean gas only or with a sample cell
[2] Not recommended for wet gas near dew point
[3] Can be reconfigured in the field
[4] Maximum O₂ concentration: 25 vol.-% (higher concentrations are not covered by the FM standards)
[5] Can be reconfigured in the field (requires a serial interface and a terminal program on PC). Reconfiguration should be done only in a non-hazardous area!
[6] Selectable only for the output range of 4 ... 20 mA
[7] Factory setting: 10 vol-% O₂
[8] Cable gland usable only in the USA according to FM approval
[9] PTFE filter for reference gas inlet recommended

FOR SAFETY AND PRODUCTIVITY: SICK LIFE TIME SERVICES

SICK LifeTime Services is a comprehensive set of high-quality services provided to support the entire life cycle of products and applications from system design all the way to upgrades. These services increase the safety of people, boost the productivity of machines and serve as the basis for our customers’ sustainable business success.

Consulting & Design
Globally available experts for cost-effective solutions

Product & System Support
Fast and reliable, by telephone or on location

Verification & Optimization
Checks and recommendations for increased availability

Upgrade & Retrofits
Uncovers new potential for machines and systems

Training & Education
Employee qualification for increased competitiveness
SICK AT A GLANCE

SICK is a leading manufacturer of intelligent sensors and sensor solutions for factory, logistics, and process automation. With more than 6,000 employees and over 40 subsidiaries worldwide, we are always close to our customers. A unique range of products and services creates the perfect basis for controlling processes securely and efficiently, protecting individuals from accidents and preventing damage to the environment.

We have extensive experience in various industries and understand their processes and requirements. With intelligent sensors, we can deliver exactly what our customers need. In application centers in Europe, Asia and North America, system solutions are tested and optimized in accordance with customer specifications. All this makes us a reliable supplier and development partner.

Comprehensive services round out our offering: SICK LifeTime Services provide support throughout the machine life cycle and ensure safety and productivity.

For us, that is “Sensor Intelligence.”
