

**English**

**Photoelectric Reflex Switch**  
with visible redlight  
**Operating instructions**

**Safety specifications**

- No safety component in accordance with EU machine guidelines.
- Read the operating instructions before starting operation.
- Connection, assembly, and settings only by competent technicians.
- Protect the device against moisture and soiling when operating.

**Proper use**

The WS / WE150 through-beam photoelectric switch is an opto-electronic sensor, that operates using a transmission unit (WS) and reception unit (WE). It is used for optical, noncontact detection of objects, animals, and people.

**Starting operation**

- WE150-P and -N only:**  
L: Light-switching; if light received, output (Q) switches.  
D: dark-switching, if light interrupted, output (Q) switches.  
Select desired operating mode externally and connect as per connection diagram **B** (L / D =control wire).
- With following connectors only:**  
Connect and secure cable receptacle tension-free.  
**Only for versions with connecting cable:**  
The following apply for connection in **B**: brn = brown, blu = blue, blk = black, wht = white.  
Connect cables.
- Use mounting holes to mount WS and WE opposite each other and align roughly. Adjust for scanning range (see technical data at end of these operating instructions and see diagram; x = scanning range, y = operating reserve, ys = switching threshold). Connect WS and WE to operating voltage (see type label). Connect L / D-control wire (wht / pin 2) with V+.  
Adjustment of light reception:  
Determine on / off points of switching output (WE) by swivelling photoelectric switch horizontally and vertically. Select middle position so that red sender beam hits receiver. With optimum light reception, switching output (WE) lights up. If it does not light up, no or not enough light is being received: readjust and / or clean WS and WE.

- 3a** LED-indicator (green): Stability (only WE).
- 3b** LED-indicator (orange): Output active (only WE).
- 4** Object detection check:

Move the object into the beam; the switching output (WE) should switch off. If it does not switch off, reduce the sensitivity using the control knob until it switches off. It should switch on again when the object is removed. If it does not switch on again, adjust the sensitivity until the switching threshold is set correctly. If switching output (WE) does not go out while object is in beam, light attenuation is too low (e. g. objects too small, transparent objects).

**Maintenance**

SICK photoelectric sensors do not require any maintenance. We recommend doing the following regularly:  
- clean the external lens surfaces  
- check the screw connections and plug-in connections  
No modifications may be made to devices.  
Subject to change without notice. Specified product properties and technical data are not written guarantees.

**Deutsch**

**Einweg-Lichtschranke**  
mit sichtbarem Rotlicht  
**Betriebsanleitung**

**Sicherheitshinweise**

- Vor der Inbetriebnahme die Betriebsanleitung lesen.
- Anschluß, Montage und Einstellung nur durch Fachpersonal.
- Gerät bei Inbetriebnahme vor Feuchte und Verunreinigung schützen.
- Kein Sicherheitsbauteil gemäß EU-Maschinenrichtlinie.

**Bestimmungsgemäße Verwendung**

Die Einweg-Lichtschranke WS / WE150 ist ein optoelektronischer Sensor, der mit einer Sende- (WS) und Empfangseinheit (WE) arbeitet. Sie wird zum optischen, berührungslösen Erfassen von Sachen, Tieren und Personen eingesetzt.

**Inbetriebnahme**

- Nur WE150-P und -N:**  
L: hellschaltend, bei Lichtempfang schaltet Ausgang (Q);  
D: dunkelschaltend, bei Lichtunterbrechung schaltet Ausgang (Q).  
Gewünschte Betriebsart extern wählen und laut Anschlussschema **B** anschließen (L / D = Steuerleitung).
- Nur bei den Steckerversionen:**  
Leitungsdose spannungsfrei aufstecken und festschrauben.  
**Nur bei den Versionen mit Anschlussleitung:**  
Für Anschluss in **B** gilt: brn = braun, blu = blau, blk = schwarz, wht = weiß.  
Leitungen anschließen.
- WS und WE mit Befestigungsbohrungen an Halter (z. B. SICK-Haltewinkel) gegenüberliegend montieren und grob ausrichten. Dabei Reichweite beachten (s. technische Daten am Ende dieser Betriebsanleitung und s. Diagramm; x = Reichweite, y = Funktionsreserve, ys = Schaltschwelle).  
WS und WE an Betriebsspannung legen (s. Typenaufdruck).  
L / D-Schalteingang (wht / Pin2) auf +V legen.  
Justage Lichtempfang:  
Ein-Ausschaltpunkte der Schaltausgangsanzeige (WE) durch horizontales und vertikales Schwenken der Lichtschranke ermitteln. Mittelstellung so wählen, dass der rote Sendelichtstrahl auf dem Empfänger auftrifft. Bei optimalem Lichtempfang leuchtet die Schaltausgangsanzeige (WE) permanent. Leuchtet sie nicht, wird kein oder zuwenig Licht empfangen: WS und WE neu justieren bzw. reinigen.  
**3a** LED-Anzeige (grün): Stabilitätsanzeige (nur WE).  
**3b** LED-Anzeige (orange): Ausgang aktiv (nur WE).
