

ENGLISH

Photoelectric Proximity Switch
with foreground blanking
Operating Instructions

Safety Specifications

- Read the operating instructions before starting operation.
- Connection, assembly, and settings only by competent technicians.
- Protect the device against moisture and soiling when operating.
- No safety component in accordance with EU machine guidelines.

Proper Use

The WT 12-2 VGA photoelectric proximity switch is an optoelectronic sensor and is used for detection of optical, non-contact detection of objects, animals, and people.

Starting Operation

- PNP:
D: dark-switching, if light interrupted, output HIGH,
L: light-switching, if light received, output HIGH.
NPN:
D: dark-switching, if light interrupted, output LOW,
L: light-switching, if light received, output LOW.
- With following connectors only:** Connect and secure cable receptacle tension-free.
- Mount sensor to suitable holders (e.g. SICK mounting bracket). Maintain direction in which object moves relative to sensor. Connect photoelectric proximity switch to operating voltage (see type label).
- Check application conditions such as scanning distance, object size and reflective capability of the object to be detected as well as the foreground, and compare them with the characteristics in the diagram (x=scanning distance, y=transitional area between the scanning distance set and the reliable foreground blanking (z) in % of the scanning distance; Ro=reflectance object; Rv=reflectance foreground).
Reflectance: 6% = black; 18% = gray; 90% = white (with respect to standard white according to DIN 5033).
- Adjustment of the light received:
Set the scanner to max.
Align the light spot to the background. The visible red transmission light spot should be perceptible on the background.
The LED signal strength indicator must light up. If it does not light up, readjust or clean the photoelectric proximity switch or check its application conditions.

- Setting the scanning distance:
Position the object; the LED signal strength indicator must switch off (position A=max.). If it continues to be lit, turn the knob in the direction of min. until it switches off (e.g., position A).
Turn the knob to min., and remove the object.
Turn the knob in the direction of max. until the LED signal strength indicator lights up (e.g., position B).
If position B < position A:
Select the middle position (e.g., position C). Check overall functioning. If the device functions correctly, the setting is completed.
- If it does not function correctly, check and readjust the application conditions.

Maintenance

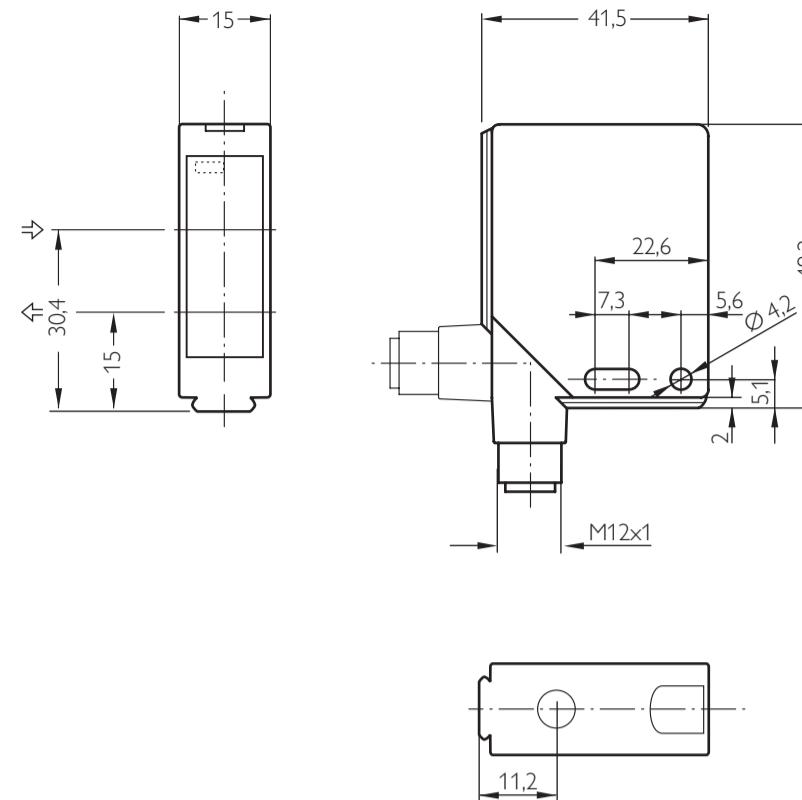

SICK photoelectric switches do not require any maintenance. We recommend that you clean the optical interfaces and check the screw connections and plug-in connections at regular intervals.

Reflexions-Lichttaster
mit Vordergrundabblendung
Betriebsanleitung

Sicherheitshinweise

- Vor der Inbetriebnahme die Betriebsanleitung lesen.
- Anschluss, Montage und Einstellung nur durch Fachpersonal.
- Gerät bei Inbetriebnahme vor Feuchte und Verunreinigung schützen.
- Kein Sicherheitsbauteil gemäß EU-Maschinenrichtlinie.

Bestimmungsgemäße Verwendung

Der Reflexions-Lichttaster WT 12-2 VGA ist ein optoelektronischer Sensor und wird zum optischen, berührungslosen Erfassen von Sachen, Tieren und Personen eingesetzt.

Inbetriebnahme

- PNP:
D: dunkelschaltend, bei Lichtunterbrechung Ausgang HIGH,
L: hellschaltend, bei Lichtempfang Ausgang HIGH.
Nur WT-2N:
D: dunkelschaltend, bei Lichtunterbrechung Ausgang LOW,
L: hellschaltend, bei Lichtempfang Ausgang LOW.
- Nur bei den Steckerversionen:
Leitungsdose spannungsfrei aufstecken und festschrauben.

Nur bei den Versionen mit Anschlussleitung:
Für Anschluss in B gilt: brn=braun, blu=blau, blk=schwarz,
