# **1** About this document

### 1.1 Information on the operating instructions

These operating instructions provide important information on how to use devices from SICK AG.

Prerequisites for safe work are:

- Compliance with all safety notes and handling instructions supplied
- Compliance with local work safety regulations and general safety regulations for device applications

The operating instructions are intended to be used by qualified personnel and electrical specialists.

Read these operating instructions carefully before starting any work on the device, in order to familiarize yourself with the device and its functions.

The instructions constitute an integral part of the product and are to be stored in the immediate vicinity of the device so they remain accessible to staff at all times. Should the device be passed on to a third party, these operating instructions should be handed over with it.

These operating instructions do not provide information on operating the machine in which the device is integrated. For information about this, refer to the operating instructions of the specific machine.

### 1.2 Scope

These operating instructions serve to incorporate the device into a customer system. Step-by-step instructions are given for all required actions.

These instructions apply to all listed device variants of the product.

Available device variants are listed on the online product page.

www.sick.com/SLG-2

Commissioning is described using one particular device variant as an example.

### 1.3 Explanation of symbols

Warnings and important information in this document are labeled with symbols. The warnings are introduced by signal words that indicate the extent of the danger. These warnings must be observed at all times and care must be taken to avoid accidents, personal injury, and material damage.

### DANGER

.... indicates a situation of imminent danger, which will lead to a fatality or serious injuries if not prevented.

### WARNING

... indicates a potentially dangerous situation, which may lead to a fatality or serious injuries if not prevented.

### CAUTION

... indicates a potentially dangerous situation, which may lead to minor/slight injuries if not prevented.

# NOTICE

... indicates a potentially harmful situation, which may lead to material damage if not prevented.

#### 

... highlights useful tips and recommendations as well as information for efficient and trouble-free operation.

### 1.4 Customer service

If you require any technical information, our customer service department will be happy to help. To find your agency, see the final page of this document.

# i NOTE

Before calling, make a note of all type label data such as type code, serial number, etc., to ensure faster processing.

#### 2 Safety information

This document is an original document of SICK AG. All rights reserved. Subject to change without notice.

Read these safety notes and take them into account when working with the sensor. The safety notes do not describe how to use the sensor.

You can find technical data and information on commissioning the sensor in the operating instructions. They can be downloaded at this Internet site: www.sick.com (enter the part number of the sensor in the search field and you will find the operating instructions under Downloads).

- Connection, mounting, and setting is only to be performed by trained specialists.

- Not a safety component in accordance with the EU Machinery Directive.

- Do not install the sensor in places exposed to direct sunlight or other weather conditions unless this is expressly permitted in the operating instructions.

# WARNING

Electrical connections must be made in compliance with local and national electrical regulations and standards. The sensor must be protected with a fuse suitable for the cross-circuit of the connecting cable; for details, see the operating instructions.

For devices with a supply voltage > 50 V (AC), 75 V (DC):

# WARNING

Lost of electrical safety (protection class)

When commissioning, protect the device from moisture and contamination.

Unless stated otherwise in the operating instructions, the sensor may only be used in an area with maximum degree of contamination 3, maximum overvoltage category II and a maximum altitude of 2,000 m above sea level.

#### 2.1 Intended use

The SLG-2 is a switching automation light grid.

It is solely intended for the optical and non-contact detection of objects, animals, and persons.

A switching automation light grid is designed for mounting and may only be operated according to its intended function. For this reason, the switching automation light grid is not equipped with direct safety devices. The system designer must provide measures to ensure the safety of persons and systems in accordance with the legal guidelines. In the event of any other usage or modification to the SLG-2 (e.g., due to opening the housing during mounting and electrical installation) or in the event of changes made to the SICK software, any claims against SICK AG under the warranty will be rendered void.

### 2.2 Limitation of liability

Applicable standards and regulations, the latest state of technological development, and our many years of knowledge and experience have all been taken into account when assembling the data and information contained in these operating instructions. The manufacturer accepts no liability for damage caused by:

- Failure to observe the operating instructions
- Improper use
- Use by untrained personnel
- Unauthorized conversions
- Technical modifications
- Use of unauthorized spare parts, wear and tear parts, and accessories

With special variants, where optional extras have been ordered, or owing to the latest technical changes, the actual scope of delivery may vary from the features and illustrations shown here.

### 2.3 Requirements for skilled persons and operating personnel

# WARNING

Risk of injury due to insufficient training!

Improper handling of the device may result in considerable personal injury and material damage.

All work must only ever be carried out by the stipulated persons.

The operating instructions state the following qualification requirements for the various areas of work:

- **Instructed personnel** have been briefed by the operating entity about the tasks assigned to them and about potential dangers arising from improper action.
- Skilled personnel have the specialist training, skills, and experience, as well as knowledge of the relevant regulations, to be able to perform tasks assigned to them and to detect and avoid any potential dangers independently.
- Electricians have the specialist training, skills, and experience, as well as knowledge of the relevant standards and provisions to be able to carry out work on electrical systems and to detect and avoid any potential dangers independently. In Germany, electricians must meet the specifications of the DGUV V3 Work Safety Regulations (e.g., Master Electrician). Other relevant regulations applicable in other countries must be observed.

The following qualifications are required for various activities:

| Activities                                     | Qualification  |  |  |  |  |
|--|--|--|--|--|--|
| Mounting, maintenance                          | <ul><li>Basic practical technical training</li><li>Knowledge of the current safety regulations in the workplace</li></ul>  |  |  |  |  |
| Electrical installation,<br>device replacement | <ul> <li>Practical electrical training</li> <li>Knowledge of current electrical safety regulations</li> <li>Knowledge of the operation and control of the devices in their particular application</li> </ul>   |  |  |  |  |
| Commissioning,<br>configuration                | <ul> <li>Basic knowledge of the design and setup of the described connections and interfaces</li> <li>Basic knowledge of data transmission</li> <li>Knowledge of the operation and control of the devices in their particular application</li> </ul> |  |  |  |  |

| Activities   | Qualification  |
|--|--|
| Operation of the devices in their particular application | <ul> <li>Knowledge of the operation and control of the devices in their particular application</li> <li>Knowledge of the software and hardware environment in the application</li> </ul> |

## 2.4 Hazard warnings and operational safety

Please observe the safety notes and the warnings listed here and in other chapters of these operating instructions to reduce the possibility of risks to health and avoid dangerous situations.

### 2.5 Repair

The product is replaced if defective. The device is not intended to be repaired. Interference with or modifications to the device on the part of the customer will invalidate any warranty claims against SICK AG.

# **3 Product description**

### 3.1 Product identification via the SICK product ID

### SICK product ID

The SICK product ID uniquely identifies the product. It also serves as the address of the web page with information on the product.

The SICK product ID comprises the host name pid.sick.com, the part number (P/N), and the serial number (S/N), each separated by a forward slash.

For many products, the SICK product ID is displayed as text and QR code on the type label and/or on the packaging.

Product ID pid.sick.com/ P/N 1..../ S/N 1....

### 3.2 Type code

Table 1: SLG-2 type code

| Product family |   |   | Beam separation |   | Technology | Hyphen | Detection height |    |       | Optical light emission | Operating range | Interface | Connection | Housing option | Software function |    |    |
|----------------|---|---|-----------------|---|------------|--------|------------------|----|-------|------------------------|-----------------|-----------|------------|----------------|-------------------|----|----|
| 1              | 2 | 3 | 4               | 5 | 6          | 7      | 8                | 9  | 10    | 11                     | 12              | 13        | 14         | 15             | 16                | 17 | 18 |
|                |   |   |                 |   |            |        |                  | Ex | ample |                        |                 |           |            |                |                   |    |    |
| S              | L | G | 1               | 0 | S          | -      | 0                | 6  | 0     | S                      | A               | 1         | Z          | С              | 1                 | 1  | 1  |

The different characteristics of the SLG-2 devices are detailed in the following sections.

### 3.2.1 Beam separation

#### Table 2: Beam separation

| 00 | Special variant |
|----|-----------------|
| 10 | 10 mm           |
| 25 | 25 mm           |
| 50 | 50 mm           |

#### 3.2.2 Technology

#### Table 3: Technology

| 0 | Special variant |
|---|-----------------|
| S | System          |
| Т | Sender          |
| R | Receiver        |

### 3.2.3 Detection height

### Table 4: Detection height

| 000 | Special variant |
|-----|-----------------|
| 010 | 100 mm          |
| 020 | 200 mm          |
| 030 | 300 mm          |
| 040 | 400 mm          |
| 050 | 500 mm          |
| 060 | 600 mm          |
| 070 | 700 mm          |
| 080 | 800 mm          |
| 090 | 900 mm          |
| 100 | 1,000 mm        |
| 120 | 1,200 mm        |
| 140 | 1,400 mm        |
| 160 | 1,600 mm        |
| 180 | 1,800 mm        |
| 200 | 2,000 mm        |
| 220 | 2,200 mm        |
| 240 | 2,400 mm        |

### 3.2.4 Optical light emission

Table 5: Optical light emission

| 0 | Special variant |
|---|-----------------|
| S | Slim            |
| F | Flat            |

### 3.2.5 Operating range

#### Table 6: Operating range

| 0 | Special variant |
|---|-----------------|
| A | 3.5 m           |
| В | 6 m             |
| С | 1.7 m           |
| D | 2.7 m           |
| E | 1.5 m           |

### 3.2.6 Interface

### Table 7: Interface

| 0 | Special variant                                       |
|---|---|
| R | 1 x C/Q (IO-Link) + 1 x I/O<br>(sender F, receiver R) |

### 3.2.7 Connection type

<sup>1</sup> Distance from lower edge to first light beam

<sup>2</sup> Distance from upper edge to last beam

 $^{3}$   $\,$  For a detection height < 700 mm, the dimension may vary.

The SLG-2 is an optical light grid. It consists of a sender and a receiver. The sender consists of several sender elements (LEDs) and actuation electronics. The receiver consists of receiver optics, several receiver elements (photodiodes) and control unit.

#### 3.3.2 Measurement principle

Providing no object is located between the sender and receiver elements, the light beams from the sender elements will hit the receiver elements. If an object is located between the sender and receiver elements, the light beams will be blocked, depending on the size of the object.

The detection area is determined by the detection height and the sensing range of the light grid. The detection height is determined by the beam separation and the number of beams. The sensing range of the light grid is the distance between sender and receiver.

Figure 3: Detection area of the SLG-2

- ① Detection height
- 2 Beam separation
- 3 Sensing range

### 3.3.3 Detection height

The detection heights of the SLG-2 are between 100 mm and 2,400 mm:

- 100 mm increments between 100 mm and 1,000 mm.
- 200 mm increments between 1,000 mm and 2,400 mm.

#### 3.3.4 Beam separation, minimum object size, minimum object width and minimum object length

The beam separation is the distance from the center of one LED to the center of the nearest LED.

The beam separation is an important parameter for determining the resolution. To meet different resolution requirements, the SLG-2 is available with different beam separation variants.

Figure 4: Available SLG-2 beam separations

To further improve the resolution, the cross-beam function is also available.

#### Resolution/minimum object size (MDO) in parallel-beam mode

With the parallel-beam function, each light beam is received by the receiver element situated directly opposite. In order for an object to be detected continuously, it must completely cover at least one beam. This is referred to as the **Minimum Detectable Object** (MDO). The calculation of the MDO is as follows:

Figure 5: Minimum object size

- ① Beam diameter
- 2 Object is not completely reliably detected
- 3 Object is reliably detected (meets requirements of minimum detectable object size)

MDO = beam separation + 5 mm

#### Resolution / minimum object size (MDO) in cross-beam mode

The parallel-beam function is used for measuring by default. With the cross-beam function, a sender LED projects beams to several receiver diodes and evaluates them. This increases the resolution and enables the detection of smaller objects. Several cross-beam options are available:

- 3-fold cross beam: Parallel beam + the adjacent beam on each side
- 5-fold cross beam: Parallel beam + two adjacent beams on each side
- 7-fold cross beam: Parallel beam + three adjacent beams on each side
- 9-fold cross beam: Parallel beam + four adjacent beams on each side

The minimum detectable object size or the resolution depends on the position of the object within the detection area (see image).

- The cross-beam function is only useful for object detection (NBB  $\geq$  1).
- Due to the crossed beams, the cross-beam function is very useful for detecting very thin but wide objects (e.g. metal sheets).
- Use of the cross-beam function increases the response time.
- With the cross-beam function, a minimum distance needs to be maintained between sender and receiver. The minimum distance depends on the aperture angle of the light grid.

Detailed information on resolution, response times and minimum distances can be found in chapter section 11.

#### Minimum object size (MDO):

- MD0 3-fold cross beam @10 mm beam separation = up to 9 mm
- MD0 9-fold cross beam @10 mm beam separation = up to 6.5 mm

# i NOTE

Detailed information on the MDO in cross-beam mode can be found in chapter section 11.

#### Resolution/minimum object width (MOW)

For the detection of very flat objects, the cross-beam function with the 7x or 9x crossbeam option is suitable. Due to the different angles of the beams between the sender and receiver, reliable detection of even an infinitely flat object with a certain minimum width is possible.

Reliable detection depends on several factors:

- Beam separation
- Distance from sender and receiver
- Minimum width of the "infinitely" thin object
- Location of the object between sender and receiver (better resolution in the middle range)

MOW = minimum object width

Detailed technical information on the detection capability and the minimum object width can be found in section 11.1.3.

Figure 6: Detection of a very narrow object using the cross-beam function

#### Minimum object length (MOL):

The minimum object length designates the minimum length of an object that is reliably detected. Since the SLG-2 has a cycle time or minimum dwell time of a few milliseconds, the minimum object length depends on the object velocity at which the object orthogonally passes the SLG-2. A static object has a minimum object length of 3 mm. The following formula applies to the calculation of the minimum object length:

MOL = object speed x minimum dwell time + 3 mm

### NOTE

i

The minimum dwell time depends on the device type and can be determined via the information in chapter section 11.

Figure 7: Minimum detectable object length

① Minimum detectable object length

#### 3.3.5 Scan time, repeatability, minimum dwell time, response time

To prevent mutual interference between the individual beams and to achieve the resolution, the SLG-2 light grid sequentially cycles through each beam.

The time required by the light grid for one pass is called the scan time.

Due to this sequential processing, the scan time of the system depends on the number of beams. The total times are short, however, because the PSDI time between two channels is in the  $\mu$ s range.

All times given are maximum or worst-case values.

Detailed information on the times can be found in section 11.

#### Repeatability

The repeatability is the maximum difference between the response times of two switching operations. The repeatability in parallel-beam mode is thus equal to the scan time.

Repeatability = scan time

The following applies in cross-beam mode:

Repeatability = 1.5 \* scan time

### Minimum dwell time

The minimum dwell time is the time that an object must dwell between the sender and receiver in order to be reliably detected. The minimum dwell time is twice the scan time.

• Minimum dwell time = 2 x scan time

#### Response time

The response time is the maximum time it takes for an output to react following the detection of an object.

#### 3.3.6 Sensing range

Basically, the SLG-2 light grid distinguishes between the maximum sensing range and the recommended sensing range.

Furthermore, the SLG-2 light grid is available in different sensing range options.

#### Maximum sensing range

The maximum sensing range is the guaranteed working distance between sender and receiver without operating reserve or without taking into account other external influences such as contamination.

If the SLG-2 is operated within this sensing range, a clean environment and regular cleaning are required.

#### **Recommended sensing range**

Within the recommended sensing range, the light grid has the highest detection reliability with the greatest possible resistance.

#### Sensing range options

The SLG-2 light grid is available in different sensing range options. These include:

Table 15: Sensing range options

| Variant            | Recommended range | Maximum range     | Use  |
|--------------------|-------------------|-------------------|--|
| SLGxxS-xxxxARxxxxx | 440 mm - 3.500 mm | 440 mm - 4.900 mm | Standard device  |
| SLGxxS-xxxxBRxxxx  | 500 mm - 6000 mm  | 500 mm - 8500 mm  | Increased sensing range  |
| SLGxxS-xxxxCRxxxxx | 440 mm - 1.700 mm | 440 mm - 2.400 mm | Very high sunlight resistance                                  |
| SLGxxS-xxxxDRxxxx  | 500 mm - 2700 mm  | 500 mm - 3800 mm  | Increased sensing<br>range, Very high sun-<br>light resistance |
| SLGxxS-xxxxERxxxxx | 70 mm - 1.500 mm  | 70 mm - 2.150 mm  | For small sensing range  |

When using the cross-beam function, other sensing range limitations must be observed.

Detailed information can be found in section 11.

#### 3.3.7 Measurement information

The SLG-2 can output the raw data via the serial interfaces in the form of the beam status so the user can evaluate the data him/herself.

In addition, the SLG-2 can process the raw data via various functions (e.g. LBB for height measurement or zone and logic functions) and output them via a serial interface or push/pull outputs, see "Operation", page 31.

# 4 Mounting

### 4.1 Scope of delivery

- SLG-2:
  - Light grid sender + light grid receiver (when ordered as a pair)
- Quick Start Guide
- Safety notes

The mounting accessories and connecting cables are not included in the scope of delivery and must be purchased separately.

### 4.2 Mounting requirements

- Compliance with the minimum distance between sender and receiver in parallelbeam or cross-beam mode, see "Technical data", page 57.
- Typical space required for device, see "Technical data", page 57.
- Comply with technical data, such as the permitted ambient conditions for operation of the device (e.g., temperature range, EMC interference emissions, ground potential).
- To prevent condensation, avoid exposing the device to rapid changes in temperature.
- For outdoor use only with appropriate safeguard/protective housing
- Protect the device from direct sunlight.
- Only fasten the device using the slot provided for this purpose and the mounting bracket or sliding nuts available as accessories.
- Shock and vibration-free mounting

### 4.3 Mounting conditions

### Synchronization beam

For measuring tasks, it must be ensured that the first or last beam is always free, see "Sync error", page 53.

### Avoiding reflections

Reflective objects in the field of view may cause the image to be reflected or diverted away. This means that reliable detection cannot be guaranteed.

Depending on the sensing range, make sure that there are no reflective objects in the field of view of the light grid.

The minimum distance to reflective materials can be seen in the following graphic.

Figure 8: Minimum distance SLG-2 to reflective materials

- ① Minimum distance (safe)
- Minimum distance (typical)

Figure 9: Distance to reflective objects

#### Avoiding interference with other SLG-2 light grids

When several SLG-2s are mounted close to one another, there is a risk of mutual interference. Therefore, when mounting two SLG-2s close to one another, their light beams should be oriented in opposite directions.

Figure 10: Light grid installed in opposite directions R = Receiver; T = Transmitter (sender)

### NOTE

i

If the installation is not counter-rotating, make sure that there is a minimum distance between the two light grids, which can be taken from the following diagram:

Figure 11: Minimum distance between 2 SLG-2 light grids

- ① Minimum distance (safe)
- ② Minimum distance (typical)

#### 

If more than two SLG-2 light curtains are used, the FlexChain system with cascadable SLG-2 light grids is recommended.

### NOTE

i

Avoidance of influence by sunlight or external light sources: Sunlight and artificial light sources can influence the device behavior. Therefore, it is recommended to mount the receiver facing away from the light source if possible.

### 4.4 Alignment

When mounting, the sender and receiver must be aligned as accurately as possible.

The required absolute accuracy r of the alignment depends, among other things, on the sensing range d and can be calculated using the availability angle  $\alpha$ . This availability angle is  $4.5\,^\circ$ .

 $r = tan (\alpha)*d$ 

Figure 12: Alignment

#### 

An alignment aid is available via IO-Link and SOPAS ET for precise alignment of the light grids. The description can be found in chapter section 7.5.1.

### 4.5 Optical light emission

i

The SLG-2 is available in a flat version (light emission on the wide side) and a slim version (light emission on the flat side). Mounting must be done properly.

### NOTE TIP

Light emission of the light grid is always on the side of the optics front where there is **no** label.

Figure 13: Slim vs. flat

- ① Slim model: Light emission on the thin side
- 2 Flat model: Light emission on the wide side

### 4.6 Mounting the light grid

The light grids are to be mounted with the mounting accessories listed below, taking into account the distances listed below.

If large light grids or light grids in applications with high vibration and impact loads are used, the use of 2 mounting kits per light grid is recommended.

Accessories available for mounting:

- Mounting bracket BEF-SLG2-SET1 (2111623)
- Mounting slot BEF-NUT-SLG2 (2111624)

Figure 14: Mounting

Recommended holder spacing:

- 1) Distance housing edge mounting bracket  $\leq 10$  cm
- ② Distance mounting bracket mounting bracket ≤75 cm (in applications with high mechanical load ≤40 cm)

### 4.6.1 Mounting bracket BEF-SLG2-SET1

Observe the maximum torque of 2 Nm!

1. Slide the mounting bracket into the bracket on the SLG-2.

2. Rotate the mounting bracket by 90°.

Screw the mounting bracket onto the profile. Use M4 cylinder head screws with a flat washer, e.g., type DIN125 / ISO 7089. (Dimensions: 4.3 x 9 x 0.8 mm) Observe the maximum torque of 2 Nm.

NOTE

The 1° angular offset clamps the mounting bracket in place in the groove of the light grid thereby preventing it from slipping in the groove. The profile to which the light grid is fastened must provide an adequately large flat surface against which the mounting bracket and the aluminum profile of the light grid can be pressed.

### 4.6.2 Mounting bracket BEF-NUT-SLG2

Observe the maximum torque of 2 Nm!

# 5 Electrical installation

### 5.1 Notes on electrical installation

I

!

1

Ī

#### NOTICE

### Equipment damage due to incorrect supply voltage!

An incorrect supply voltage may result in damage to the equipment.

- Only operate the SLG-2 with safety/protective extra-low voltage (SELV/PELV).
- The SLG-2 is a device of protection class III.

### NOTICE

#### Equipment damage due to incorrect supply voltage!

An incorrect supply voltage may result in damage to the equipment.

Only operate the SLG-2 with an LPS (limited power source) in accordance with IEC 60950-1 or an NEC Class 2 power supply unit.

### NOTICE

Equipment damage or unpredictable operation due to working with live parts!

Working with live parts may result in unpredictable operation.

- Only carry out wiring work when the power is off.
- Only connect and disconnect electrical connections when the power is off.

### NOTICE

### Device damage due to incorrect connection!

Incorrect connection may cause damage to the SLG-2.

- The electrical installation must only be performed by electrically qualified personnel.
- Standard safety requirements must be observed when working on electrical systems!
- Only switch on the supply voltage for the device when the connection tasks have been completed and the wiring has been thoroughly checked.
- When using extension cables with open ends, ensure that bare wire ends do not come into contact with each other (risk of short-circuit when supply voltage is switched on!). Wires must be properly insulated from each other.
- Wire cross-sections in the supply cable from the user's power system must be selected in accordance with the applicable standards.
- Only operate the device with an LPS (limited power source) in accordance with IEC 60950-1 or an NEC Class 2 power supply unit.
- All circuits connected to the device must be designed as SELV/PELV circuits.

The IP enclosure rating for the device is only achieved under the following conditions:

The cables plugged into the connections are screwed tight.

If these instructions are not complied with, the IP enclosure rating for the device is not guaranteed!

### 5.2 Pin assignment of the connections

Table 16: Pin assignment

| PI | PIN Receiver Sender |   | Sender   |
|----|---------------------|---|----------|
| 1  | BN                  | + (L+)  | + (L+)   |
| 2  | WH                  | MF (In/Out)   | TEST(In) |
| 3  | BU                  | - (M)   | - (M)    |
| 4  | ВК                  | Q <sub>L1</sub> /C  | n. c.    |
| Ĺ  | +                   | $\begin{array}{c} 3 \\ 4 \\ 4 \\ 4 \\ 2 \\ 1 \\ 1 \\ 2 \\ 1 \\ 2 \\ 2 \\ 2 \\ 2 \\ 2$ |          |

The  $Q_{L1}$  / C (pin 4) and MF (pin 2) interfaces can be configured via the SOPAS engineering tool (in conjunction with the SI-LINK2 master (SICK part number: 1061790)) or directly via the IO-Link interface. MF (pin 2) can be configured as input or as output.  $Q_{L1}$ can only be configured as an output. Each digital interface can be assigned different functions, section 7.7.

#### 

If a HIGH signal is applied to sender pin 2 (Test(In)), the sender LEDs are deactivated.

Pre-configured device variants are available (see www.sick.com/SLG-2).

### 5.3 Connecting the supply voltage

!

Only connect the sensors when the supply cable is de-energized.

### NOTICE

Risk of damage to sensors

The sensors can become damaged if they are connected to a voltage supply that is already switched on.

The sensors must be connected to a power supply unit with the following properties:

- Supply voltage 18 ... 30 V DC (SELV/PELV as per currently valid standards)
- The current consumption for the system consisting of sender and receiver is between 100 mA and 420 mA, see "Technical data", page 57.

To ensure protection against short-circuits/overload in the customer's supply cables, the wire cross-sections used must be appropriately selected and protected.

# 6 Commissioning

### 6.1 Preparation

- Sender and receiver must be well aligned, see "Mounting", page 21.
- First put the receiver into operation, then the sender. After connecting the sensors, the green LED must light up on the sender and receiver (for IO-Link communication, the LEDs flash at 1 Hz (otherwise constantly on)).
- With Auto-Teach active: 0.75 s ... wait 50 s until the yellow LED stops flashing at 1 Hz.<sup>1)</sup>
- Check alignment again. As an alignment aid, the **Alignment aid** function is also available via SOPAS ET, section 7.5.1.
- No objects should be located between the sender and the receiver. The light path must be clear.

### 6.2 Teach-in

After preparation, a teach-in can now be performed.

The duration of the teach-in process depends on the number of beams, the quality of alignment, the distance between sender and receiver and the **Cross beam Setting** and can be up to 50 s.

The teach-in automatically adjusts the switching threshold of each receiver element to the received signal intensity. The signal intensity depends on the distance between sender and receiver. The teach-in achieves the optimum resistance and detection reliability.

For stable operation, it is therefore mandatory to perform a teach-in under the following conditions:

- After a power-up operation (System-power-on)
- After each mechanical adjustment of the sender and/or receiver
- After a Factory reset
- After a Teach-in error
- After beam blanking or resetting the beam blanking (Beam blanking)
- After a IO-Link data storage download
- After changing the cross-beam setting (Cross beam)
- After deactivating the Alignment aid

If the teach-in was not performed correctly, the yellow LED on the SLG-2 receiver flashes at 8 Hz for 5 seconds. At the same time, a teach-in error is communicated via IO-Link, section 7.2. If the yellow LED flashes at 2 Hz, the signal strength is not sufficient. In both cases, check the alignment of the sender and receiver and the free light path between the sender and receiver.

There are different ways to perform the teach-in:

- Auto teach-in
- Teach-in via pin 2 / MF
- Teach-in via IO-Link and SOPAS ET

#### 6.2.1 Auto teach-in

The Auto teach-in is performed automatically under the following conditions:

<sup>1)</sup> The duration depends on the number of beams and the setting of the light grid. See also sections "Technical data", page 57 "Power-up time" and "Teach-in time".

- Receiver is put into operation electrically.
- After a factory reset, if the device has activated the Auto teach-in option as the factory default.
- After an IO-Link DataStorage download, if the Auto teach-in option is set as a download parameter.

Depending on the device variant, the **auto teach-in** is active or deactivated. The setting can be changed via SOPAS ET or IO-Link, section 7.5.

### 6.2.2 Teach-in via pin 2 / MF

Pin 2 / MF can be configured as a teach-in input.

With this setting, a teach-in is performed when a signal is applied to pin 2 / MF. Depending on the device variant, this option is active or deactivated.

The pin/MF setting can be changed via SOPAS ET or IO-Link, section 7.7.

### 6.2.3 Teach via IO-Link or SOPAS ET

Teach-in can be performed at any time via IO-Link or SOPAS ET. This option is available for all SLG-2 light grid variants, section 7.5.

#### 6.2.4 Switching threshold setting after teach-in

Depending on the scenario, new switching thresholds are set after a teach-in, the teach-in results are discarded and previously stored switching thresholds are loaded, or the maximum sensitivity or maximum sensing range is set as the switching threshold.

When performing a **factory reset**, the switching thresholds are set to maximum sensitivity. A downstream teach-in is necessary.

| Action                                       | Signal strength  | Switching threshold setting, receiver        | Yellow<br>LED                 |
|--|--|--|-------------------------------|
| Delivery state or factory reset              |  | Maximum sensitivity or maximum sensing range | Deacti-<br>vated              |
| Teach-in, all<br>beams covered               | All beams < minimum sig-<br>nal                                | Maximum sensitivity or maximum sensing range | 8 Hz<br>for<br>5 sec-<br>onds |
| Teach-in for parti-<br>ally covered<br>beams | Some beams < minimum<br>signal, some beams ><br>minimum signal | Last saved teach results are used            | 8 Hz<br>for<br>5 sec-<br>onds |
| Teach-in when all beams are free             | All beams > minimum sig-<br>nal                                | New thresholds are saved and used            | Deacti-<br>vated              |

# 7 Operation

### 7.1 Configuration options

The complete configuration of the SLG-2 is possible via the IO-Link interface. Using the SiLink2 master and the SOPAS ET configuration software, the SLG-2 can be configured directly on the computer.

For configuration via SOPAS ET, the sensor-specific **SOPAS Device Description** (SDD) is required.

Both SOPAS ET and the **SOPAS Device Description** can be downloaded free of charge at **www.sick.com**.

The interface-specific settings can be found at the end of the chapter, see "IO-Link specific settings", page 48.

### 7.2 Functional structure

The graphic below describes the functional structure of the SLG-2.

Figure 15: Function overview

In **Sensor thresholds**, the switching thresholds of all beams are automatically set via the teach-in depending on the sensing range, see "Commissioning", page 29.

**Beam status:** After the teach-in, the SLG-2 is ready for operation. Now either the states of each individual beam can be output via the process data (Process data) and/or the sensor data can be used for further processing.

**Zones:** In **Zones**, areas can be defined between two beams within which an evaluation is made by selectable functions within the zone. The resulting  $Q_{int}$  signals can either be used for further processing or output directly via the process data (Process data). Furthermore, height and width information of an object within a defined zone can still be output via the process data.

#### Smart Task:

Two of the altogether four  $Q_{int}$  signals (internal) can be further processed/adapted by simple logic gates as well as by **Timing** and **Inverter** functions. Furthermore, an external input signal can be integrated into the processing. The processed signals  $Q_{L1}$  or  $Q_{L2}$  can be output via pin 4 or pin 2 (Smart Task via IO-Link) and/or via the process data (Process data).

**Process Data:** The information is transmitted to the control via a serial interface using the process data. In addition to the **Beam status** and the evaluated beam information  $Q_{int}$  and  $Q_L$ , diagnostic information can also be transmitted. An individual configuration of the process data is possible.

#### Pin:

The output of binary data is possible via pin 4 /  $Q_{L1}$  or pin 2 / MF. The pins are freely configurable. However, only pin 2 / MF can be configured as input for further processing (e.g. as Smart Task input signal) (Smart Task).

### 7.3 Structure of SOPAS

The SOPAS interface for the SLG-2 is divided into different tabs (1). Each tab provides a specific set of parameterization functions. You can easily jump back and forth between the tabs. The structure of the visualization is similar in each tab:

- Important basic information is displayed on the left side of the SOPAS window (2). This is, for example, diagnostic information (see "Diagnostics and troubleshooting", page 50) or status of the  $Q_Ls$ .
- The **Beam status** can be seen in the middle of the screen (3). When a beam is free, it is displayed in green with a continuous line. If the beam is blocked by an object, the beam is displayed with a red dashed line. The light grid orientation (male connector down or up) as well as blanked beams (gray display) are also displayed.
- On the right side of the SOPAS window (4), you can either make settings or call up individual information.

Figure 16: Structure of SOPAS – Home tab

### 7.4 Basic information on SLG-2

The **Home** tab (see figure 16, page 32) is used to get information and states about the connected SLG-2. This includes information such as detailed product information and performance values of the SLG-2.

### 7.4.1 Basic information on SLG-2 via IO-Link

| IO-Link Index                 | Object name   | Description   |
|-------------------------------|---|---|
| 16, 17, 18, 20, 21,<br>22, 23 | Vendor Name, Vendor Text, Product<br>Name, Product Text, Serial Number,<br>Hardware Version, Firmware Version | Indices output different basic information of the light grid.   |
| 24                            | Application Specific Tag  | A freely selectable name (e.g.<br>name of the application) can be<br>assigned.  |
| 64                            | Device specific tag   | A freely selectable name (e.g. device name) can be assigned.  |
| 84                            | System properties   | Retrieval of various system infor-<br>mation such as response time,<br>number of beams, beam sepa-<br>ration, etc.  |
| 99                            | Teach-in necessary  | Indicates when a teach-in is necessary  |
| 100                           | System status   | Contains general diagnostic<br>information such as error<br>and/or warning message such<br>as quality of run alarm, teach-in<br>error, hardware error, etc.   |
| 204                           | Find me   | Command that makes the LEDs<br>of the SLG-2 receiver flash to<br>make it easier to find in the sys-<br>tem.   |
| 219                           | Product ID  | Outputs the part number   |
| 480                           | Beam status (PDin)  | Information about the status of<br>each individual beam (object<br>there or not). This information is<br>the raw data of the SLG-2. It car<br>be output via the process data<br>or used for further processing. |
| 481                           | Q <sub>L</sub> /Q <sub>int</sub> status   | Outputs the Smart Task information $Q_L$ 1-2 and the zone information $Q_{int}$ 1-4.  |

Table 17: Basic information via IO-Link with associated index

# NOTE

1

Detailed information on the subindices and access can be found in the IO-Link supplement (8026809).

### 7.5 General settings

Figure 17: SOPAS - General settings tab

The following settings are possible in the General settings tab:

- Switching threshold setting: The SLG-2 receiver is set to an optimum switching threshold via the **Teach-in** to ensure reliable detection with sufficiently high resistance to contamination or other influences.
- Alignment aid: The Alignment aid function helps to optimally align the light grids (see "Alignment aid via SOPAS ET", page 34)
- Auto teach-in: A teach-in is performed automatically after connection to the voltage supply (see "Auto teach-in", page 29).
- Beam blanking: The **Beam blanking** can be used to blank beams that are not to be taken into account in the evaluation. This is useful if, for example, a static object is permanently blocking the light path. The following options are available:
  - Beam blanking by pressing the CTRL key while clicking on the beam that is to be blanked
  - Blank currently made beams blanks all beams that are not blocked by an object during execution.
  - Blank currently blocked beams blanks all beams that are blocked by an object during execution.
  - Reset blanking: Switches all beams back to active
- Cross beam: The Cross beam function can be used to increase the resolution in certain ranges. For this purpose, a 3-fold and, for certain variants, also a 5-fold, 7-fold or 9-fold crossover is available. The amount of maximum possible crossover also depends on the distance between the sender and receiver. Detailed information on the cross-beam function can be found in section 3.3.4.
- **Beam numeration**: The order of beam numbering can be changed. This also outputs the **Beam status** in a different order.
- Beam number 1 is at connector side: Beam numbering starts at the male connector side of the housing.
- Beam number 1 is at head side: Beam numbering starts at the front of the housing.

### 7.5.1 Alignment aid via SOPAS ET

With the Alignment aid, an alignment aid is available via IO-Link for precise alignment of the SLG-2 light grid (see "General settings via IO-Link", page 35). The values can be displayed graphically via SOPAS ET.

Figure 18: Graphical representation of Alignment aid in SOPAS ET

The Alignment aid shows the percentage signal level of the following beams:

- First beam not blanked
- Last beam not blanked
- Weakest non-blanked beam

The values of Alignment aid are to be interpreted as follows:

< 50%:</th>Insufficient signal strength for stable detection with operating reserve50% - 85%:Sufficient signal strength for stable detection with operating reserve> 85%:Optimal signal strength for stable detection with operating reserve

Aligning the SLG-2 light grid with the Alignment aid function:

- 1. Set up **Alignment aid**: For optimal function of the **Alignment aid**, move the light grid up and down until signal strength 0% is displayed on each side (first/last beam).
- 2. Align the sender and receiver with respect to each other until a value of at least 50% is reached for each beam shown in the **Alignment aid**.
- 3. Perform teach-in.

The Alignment aid is automatically deactivated for the following reasons:

- Teach-in command
- Restore factory settings
- IO-Link DataStorage download
- Hardware error

#### 

When Alignment aid is active, the light grid cannot perform detection, it is not ready for operation. Process data and detection information are not transmitted. If the Alignment aid is active, the Invalid process data flag is set.

#### 7.5.2 General settings via IO-Link

Table 18: General settings via IO-Link with associated index

| IO-Link Index | Object name                     | Description         |
|---------------|---------------------------------|---------------------|
| 2             | Standard Command 160 / Teach-In | Performs a teach-in |

| IO-Link Index | Object name   | Description  |
|---------------|---|--|
| 2             | Standard Command 208 / Blank all<br>currently blocked beams | Blanks all currently blocked<br>beams. Blanked beams are no<br>longer taken into account in<br>object detection.   |
| 2             | Standard Command 209 / Blank all<br>currently made beams    | Blanks all currently free beams.<br>Blanked beams are no longer<br>taken into account in object<br>detection.  |
| 66            | Performance options   | <b>Cross beam</b> can lead to an<br>improvement in resolution. The<br>height of the adjustable cross-<br>over depends on the SLG-2 var-<br>iant used.  |
| 69            | Alignment aid enable  | Activation or deactivation of the<br>alignment aid. When the align-<br>ment aid is active, no process<br>data or detection information is<br>transmitted.  |
| 71            | Auto teach-in   | When activated: After connect-<br>ing the voltage supply, a teach-<br>in is performed automatically.   |
| 72            | Beam mask   | Individual blanking of individual beams. The blanked beams are not considered in the evaluation.   |
| 74            | Beam numeration   | Command changes the beam<br>order:<br>true = 1. Beam at front side<br>false = 1. Beam at male connec-<br>tor side  |
| 109           | Alignment aid   | Displays the signal strength<br>of the three beams relevant<br>for alignment, each in a subin-<br>dex. Values from 0-100 (percen-<br>tages). Value 255 is displayed<br>for a <b>Hardware error</b> . |

Detailed information on the subindices and access can be found in the IO-Link supplement (8026809).

# 7.6 Zones / Q<sub>ints</sub>

In the  $Zones/Q_{int}$  tab, it is possible to define several ranges or zones.

A maximum of 4 zones can be defined.

The zones are displayed in tabular form on the right side. You can parameterize the zones there. The zones are also shown in the system schematic (center).

Specific measurement functions can be defined within each zone. The result is passed on to an internal output state ( $Q_{int}$ ), which in turn can be used for further functions (Smart Task). The  $Q_{int}$  status and measurement results of a zone can also be output via the serial interface (Process data).

Figure 19: SOPAS tab Zones/Qints

You can individually select each zone in the right hand area of the screen and parameterize the zone. The **Status** column shows whether the internal output state  $Q_{int}$  is active or not.

| Qint From | То | Function |        | Measurement | Operator     |        | Constant | View | Status |
|-----------|----|----------|--------|-------------|--------------|--------|----------|------|--------|
| 1 3       | 20 | NBB      | ~      | 12          | =            | $\sim$ | 10       | ✓    |        |
| 2 1       | 20 | LBB      | $\sim$ | 20          | 2            | $\sim$ | 10       | •    | 1 - C  |
| 3 10      | 15 | NBB      | ~      | 6           | ≥            | ~      | 1        | ✓    | •      |
| 4 1       | 20 | FBB      | ~      | 8           | ≤            | ~      | 10       | ✓    | 1 - C  |
|           |    |          |        |             | = (Equal)    |        |          |      |        |
|           |    |          |        |             | ≠ (Unequal)  |        |          |      |        |
|           |    |          |        |             | > (Greater)  |        |          |      |        |
|           |    |          |        |             | ≥ (Greater o | r Equa | al)      |      |        |
|           |    |          |        |             | < (Less)     |        |          |      |        |
|           |    |          |        |             | ≤ (Less or E | qual)  |          |      |        |
|           |    |          |        |             |              |        |          |      |        |

Figure 20: Overview of the zone configuration

The zone range can be set in the parameterization area (e.g. from beam 1 – beam 50). Furthermore, different measuring functions can be defined within a zone.

These include:

- NBB = Number of beams blocked; Object detection or width classification
- FBB/LBB: First beam blocked / Last beam blocked: Mainly used for height measurement, height classification or position determination.
  - FBB: Beam number of the first interrupted beam of a zone
  - LBB: Beam number of the last interrupted beam of a zone

#### Examples

#### Example 1 object detection with NBB:

Any object that interrupts at least one light beam should be detected.

NBB  $\ge$  1 for object detection: Q<sub>int</sub> 3 active if at least 1 beam is interrupted

### Example 2 width classification with NBB:

It should be detected when objects have the width of 10 light beams.

NBB = 10 for width classification:

 $Q_{\text{int}} \, 1$  active if exactly 10 beams are interrupted in a zone

Figure 21: Width classification with NBB, example 2

### Example 3 height classification with FBB:

Boxes above a certain size should be detected (large or larger than shown in the figure). The light grid is mounted from above (connection side at the top). The objects travel, for example, on a conveyor belt between the light grid.

#### FBB $\leq 10$ :

If within zone 4 the first interrupted beam is 10 or lower, internal switching signal  $Q_{int}$  4 is activated:

Figure 22: Height measurement with FBB, example 3

If a box is smaller than shown in the graphic, the first interrupted light beam is > 10 and internal switching signal  $Q_{int}$  4 remains deactivated.

Example 4 height classification with LBB:

Boxes above a certain size should be detected (large or larger than shown in the figure). The light grid is mounted from below (connection side down). The objects travel, for example, on a conveyor belt between the light grid.

#### LBB ≥ 10:

If within zone 2 the last interrupted beam is 10 or greater, internal switching signal  $Q_{\text{int}}\mathbf{2}$  is activated.

Figure 23: Height measurement with LBB, example 4

If a box is smaller than shown in the graphic, the first interrupted light beam is < 10 and the internal switching signal  $Q_{int}$  2 remains deactivated.

#### Example 5 position determination with FBB:

The position of a box on a conveyor belt is to be detected. The light grids are mounted along a conveyor belt with the connection side on the left. The box moves from right to left. As soon as the box is in the position of the 10th light beam, the light grid switches.

FBB = 10:

If beam 10 is interrupted within zone 4, internal switching signal  $\ensuremath{\mathsf{Q}_{\text{int}}}\xspace^2$  is activated.

Figure 24: Position determination with FBB, example 5

Example 6 position determination with LBB:

The position of a box on a conveyor belt is to be detected. The light grids are mounted along a conveyor belt with the connection side on the left. The box moves from left to right. As soon as the box is in the position of the 10th light beam, the light grid switches.

### LBB = 10:

If beam 10 is interrupted within zone 2, internal switching signal  $\ensuremath{\mathsf{Q}_{\text{int}}}\xspace^2$  is activated.

Figure 25: Position determination with LBB, example 6

# 7.6.1 Zones/Q<sub>ints</sub> via IO-Link

Table 19: Zones/Q<sub>ints</sub> via IO-Link with associated index

| IO-Link Index      | Object name                               | Description  |
|--------------------|---|--|
| 351, 353, 355, 357 | Q <sub>int</sub> zone definition 1-4      | Zone definition with one start beam and one end beam   |
| 352, 354, 356, 358 | Q <sub>int</sub> advanced settings<br>1-4 | Definition of the LBB, FBB and NBB measurement function with operator and constant. The result ( $Q_{int}$ ) is a boolean value. |
| 481                | Q <sub>L</sub> / Q <sub>int</sub> status  | Outputs the Smart Task information $Q_L$ 1-2 and the zone information $Q_{int}$ 1-4.   |

## NOTE

i

Detailed information on the subindices and access can be found in the IO-Link supplement (8389226).

|  |                |          |   |                     |
|  |                |          |   |                     |

Figure 26: SOPAS - Smart Tasks tab

Using the **Smart Task** tab, the states of the individual zones ( $Q_{int}1 - Q_{int}4$ ) can be processed further and thus simple evaluations / size comparisons can be carried out. These  $Q_{int}$  states as well as an external input signal are possible input variables which are available for selection in the **Input selector**.

Via the settings for Logic 1/2, the input signal of Input selector 1 can be logically linked with the input signal of Input selector 2 . OR and AND logic gates are available for this purpose.

Figure 27: Logical principle of operation of the Smart Task function

Various delay modes can be selected via Timer  $1/2 \mod e$ . The associated delay time is set via Time 1/2 setup. See the graph below for details on how the various modes work.

Figure 28: Mode of operation of time modes

# NOTE

i

Inverting the Timer 1/2 output signal does not affect how the delay modes work. Note that due to the inversion of the Timer 1/2 output signal, a set switch-on delay, for example, can act like a switch-off delay.

Inverter 1/2 inverts the logic state of the Timer 1/2 output signal.

 $Q_{L1} / Q_{L2}$  output the result of the **Smart Task**. The state of  $Q_{L1}$  is output via pin 4 (unless pin 4 is used as an IO-Link interface).

Pin 2 can output the  $Q_{L2}$  state or alternatively be configured for other purposes. Pin 2 is therefore also called MF (Multi Function). The following configuration is possible:

- External input: If pin 2 / MF is configured as External input, this is available for selection in Input selector 1/2
- Blocked beams hold: If the input signal is 1 ("HIGH"), the Blocked beams hold function is set. In this case, once interrupted, beams remain set or are held. Thus, only one status change of a beam from 0 to 1 is possible. This function is suitable, for example, to determine the highest point of an object. If the input signal is 0 ("LOW"), the Block beams hold function is deactivated. The Blocked beam hold function is deactivated. The process data is no longer held.
- Teach-in: A teach-in can be performed via an input signal, see "Commissioning", page 29.
- Switching signal  $Q_{L2}$ : Output of  $Q_{L2}$  state via pin 2 / MF
- Masked system status: A selection of diagnostic information can be output via pin 2 / MF as an alarm signal output, see "Diagnostic settings", page 45.

Figure 29: Possible pin 2 configurations

## 7.7.1 Smart Task via IO-Link

Table 20: Smart Task via IO-Link with associated index

| IO-Link Index         | Object name                              | Description  |
|-----------------------|--|--|
| 121                   | Pin 2 configuration                      | Configuration of pin 2 output or input function  |
| 481                   | Q <sub>L</sub> / Q <sub>int</sub> (PDin) | Outputs the $Q_L / Q_{int}$ states.  |
| 1081                  | Input selector 1                         | Selection of zone values Q <sub>int</sub> 1-4<br>or an external input signal <b>Ext</b><br><b>input 1</b> as logical input signal    |
| 1082 Input selector 2 |  | Selection of zone values Q <sub>int</sub> 1-4<br>or an external input signal <b>Ext.</b> -<br><b>input 1</b> as logical input signal |
| 1083                  | Logic 1                                  | AND or OR logic to the possible<br>input signals Q <sub>int</sub> 1-4 or Extinput<br>1   |
| 1084                  | Logic 2                                  | AND or OR logic to the possible input signals Q <sub>int</sub> 1-4 or Extinput 1   |
| 1085                  | Timer 1 mode                             | Delay modes adjustable: <b>T-On</b><br>Delay, <b>T-Off Delay</b> ,   |
| 1086                  | Timer 2 mode                             | Delay modes adjustable: <b>T-On</b><br>Delay, T-Off Delay,   |
| 1087                  | Time 1 setup                             | Delay values in ms can be set  |
| 1088                  | Time 2 setup                             | Delay values in ms can be set  |
| 1089                  | Inverter 1                               | Inverts the logic state of the <b>Timer 1</b> output signal  |
| 1090                  | Inverter 2                               | Inverts the logic state of the <b>Timer 2</b> output signal  |
| 1093                  | Inverter Ext.input                       | Inverts the external input signal  |

NOTE

Detailed information on the subindices and access can be found in the IO-Link supplement (8026809). For additional information on the Smart Task, refer to instructions 8022709, chapter 7.9.1.

## 7.8 Process data

Various output states as well as measurement and diagnostic information can be transmitted via IO-Link. The process data word has a length of 32 bytes. Each of these bytes can be individually populated with the desired data.

## 7.8.1 Manually customizing the process data

Each individual byte of the process data can be customized. After clicking on a byte, a drop-down list of information that can be assigned to the byte is displayed. The length of each "information block" is limited to one byte (8 bits). A single byte can therefore be used, for example, to transmit 8 beam states.

NBB, FBB and LBB are the actual measured values. For example, NBB transmits how many light beams in the zone are blocked.

In addition, the  $Q_{int}$  status (states of zones 1-4) and the  $Q_L$  status (Smart Task states) can be transmitted via a byte.

The System Status is a diagnostic byte that transmits various diagnostic information, section 7.2.

| Configure Byte 2 |       |        |  |  |  |  |

## 7.8.2 Process Data via IO-Link

Table 21: Process data via IO-Link with associated index

| IO-Link Index | Object name                  | Description  |
|---------------|------------------------------|--|
| 67            | Process data user definition | Configuration of the process<br>data. Each process data slot<br>with a size of 8 bits can be<br>assigned a process data func-<br>tion. |
| 40            | Process data input           | Index for reading out the 32-<br>byte process data via the serv-<br>ice data channel   |

# NOTE

i

Detailed information on the subindices and access can be found in the IO-Link supplement (8026809).

## 7.9 Diagnostic settings

Various diagnostic settings can be configured in the Settings tab. These include:

| SLG10R-020FAI       |      | ES / QINTS SMART TASK PROCE                       |                        |   |                          |          |                  |                               |  |
|---------------------|------|---|------------------------|---|--------------------------|----------|------------------|-------------------------------|--|

Figure 33: Diagnostic settings

- Events and IO-Link PDinvalid can be activated or deactivated via Notification handling. Various events such as overtemperature, short-circuit etc., are available, see IO supplement 8026809. PDinvalid means invalid process data.
- **Factory reset**: Restores all settings to the factory defaults. Subsequent switching threshold setting via teach-in is necessary. Further settings may have to be made.
- Quality of run alarm time filter: The filter can be used to select the time from which the Quality of run alarm signal becomes active. If the time is set very short, activation is possible if an object is in the light path for a longer time. Since the signal is mainly used to detect contamination, a time filter of several minutes is usually sufficient.
- Masked system status: A selection of diagnostic information can be output via an alarm signal output. It is an "OR" function of several diagnostic input signals which can be output as a binary signal via pin 2 / MF (see table 22). You can adjust or reduce the diagnostic information.

Table 22: Masked system status via pin 2 / MF output as bit information

- Operating temperature diagnostic: Output of the device temperature. Temperature changes can indicate changing ambient conditions, a defect in the device or in the application. Various temperature values are output and limits can be set:
  - Temperature all time: Maximum/minimum measured temperature since initial commissioning
  - Temperature since last reset: Maximum/minimum measured temperature since last Temperature reset commissioning

 Temperature thresholds: Highest/lowest permissible temperature limits can be set. If the temperature is exceeded or undercut, a warning signal is output (see "Diagnostics and troubleshooting", page 50).

The device temperature is different from the ambient temperature. The temperature that is output is based on a measurement inside the microcontroller, so the numerical value is significantly higher than the ambient temperature. Exceeding the warning threshold as per the factor settings will not necessarily lead to a defect in the device. Since the temperature is only measured at one point inside the device, other temperatures may prevail at other points inside the device.

- **Operating hours diagnostics:** Output of the operating hours as well as parameterization option of operating hour limits:
  - o Total operating hours: Total operating hours since initial commissioning
  - o Operating hours since last reset: Operating hours since the last reset
  - Operating hours threshold: Maximum permissible operating hours can be parameterized. If this value is exceeded, a warning signal is output (see "Diagnostics and troubleshooting", page 50).

**Condition Monitoring** 

| Actual temperature (°C)  | 59       |                  |                               |
|--------------------------|----------|------------------|-------------------------------|
| Operating limits         |          |                  |                               |
|                          | All time | Since last reset | Threshold for<br>alarm output |
| Maximum temperature (°C) | 64       | 63               | 80                            |
| Minimum temperature (°C) | 19       | 21               | -10                           |
| Operating hours          | 221      | 67               | 100                           |
|                          |          | Reset            |                               |

Figure 34: Temperature values and temperature limits

#### 7.9.1 Diagnostic settings via IO-Link

Table 23: Diagnostic settings via IO-Link with associated index

|               | -   |   |
|---------------|---|---|
| IO-Link Index | Object name                                       | Description   |
| 2             | System command 130 / Factory reset                | All settings are reset to the fac-<br>tory settings.                          |
| 2             | Standard Command 228 / Reset diagnostic parameter | Resets the measured max/min temperatures (153) and the operating hours (190). |
| 153           | Current temperature                               | Outputs the current measured device temperature                               |
| 153           | Maximum temperature all time                      | Outputs the maximum meas-<br>ured temperature value                           |
| 153           | Minimum temperature all time                      | Outputs the minimum measured temperature value                                |

| IO-Link Index                 | Object name                          | Description  |  |
|-------------------------------|--------------------------------------|--|--|
| 153                           | Maximum temperature since last reset | Outputs the maximum meas-<br>ured temperature value since<br>the last reset  |  |
| 153                           | Minimum temperature since last reset | Outputs the minimum measured temperature value since the last reset  |  |
| 179                           | Upper temperature threshold          | Defines the maximum tempera-<br>ture value above which a warn-<br>ing is to be issued  |  |
| 179                           | Lower temperature threshold          | Defines the minimum tempera-<br>ture value below which a warn-<br>ing is to be issued  |  |
| 179 Operating hours threshold |                                      | Defines the maximum operatin<br>time from which a warning is to<br>be issued   |  |
| 190                           | Total operating hours                | Outputs the total operating time   |  |
| 190                           | Operating hours since last reset     | Outputs the operating time since the last reset  |  |
| 227                           | Notification handling                | Activating / deactivating of<br>events and the IO-Link <b>PDinvalid</b><br>(event codes on the last page of<br>the IO-Link supplement) |  |
| 311                           | Quality of run alarm on time filter  | Setting a warning after a critical signal strength is detected at the sensor for the defined duration                                  |  |
| 312                           | Quality of run alarm off time filter | Resetting a warning after no<br>reduced signal strength is<br>detected at the sensor for the<br>defined duration.                      |  |
| 447 Pin 2 system status mask  |                                      | Selection of diagnostic informa-<br>tion that can be output via an<br>OR function as a Boolean value<br>via pin 2.                     |  |

#### 

Detailed information on the subindices and access can be found in the IO-Link supplement (8026809).

# 7.10 IO-Link specific settings

The SLG-2 light grids have an IO-Link interface. IO-Link enables the exchange of process, service and diagnostic data.

## Configuration via acyclic service data

Functions such as zone definition, a teach-in or cross-beam option (**Cross beam** option) can be parameterized via the service data. The indices of the service data are listed in section 7 and can be found in the IO-Link supplement. The IO-Link supplement can be found online for the respective product number. Various diagnostic information can be transmitted via the process date.

# NOTE

i

Detailed information on the subindices and access can be found in the IO-Link supplement (8026809).

## Data Storage

The **Data Storage** IO-Link function can be used to save all relevant parameters of the SLG-2 light grid in an IO-Link master. If the device is replaced, these parameters can be written to the new device, or they can be distributed to multiple other SLG-2 light grids with the same variant and with the same application.

# i NOTE

After a **Data Storage** download, the **Teach-in status** of the SLG-2 light grid is reset. This means that a teach-in is necessary. If **Auto teach-in** is set, the teach-in is performed automatically on restart.

### Process data output

Transmission data

- Minimum cycle time of IO-Link: 2.3 ms
- Baud rate: COM3 (230.4 kbaud)
- Process data length: 32 bytes
- IO-Link version: 1.1.0

# 8 Diagnostics and troubleshooting

# 8.1 IO-Link specific diagnostic information

#### 8.1.1 Device Status

General diagnostic information is available via IO-Link through the **Device Status** object. **Device Status** information (e.g. **Maintenance required**) can have several causes (e.g. **Quality** of run alarm or **Teach-in error**) (see table 25).

Table 24: IO-Link Device Status

| IO-Link Index | Object name   | Description  |  |
|---------------|---------------|--|--|
| 36            |               | Provides information about the general state of the light grid |  |
| 30            | Device Status | general state of the light gift                                |  |

Table 25: Values in the Device Status

| Value = priority<br>ascending | Definition           | Event (System Status)  |
|-------------------------------|----------------------|--|
| 0                             | Device is in order   | -  |
| 1                             | Maintenance required | Quality of run alarm, Temperature or Operating hours alarm, Teach-in error, Teach-in necessary |
| 2                             | Out of specification | Not in use   |
| 3                             | Functional check     | Busy, Sync error   |
| 4                             | Failure              | Hardware error, Pin short circuit error  |

#### 

Detailed information on the subindices and access can be found in the IO-Link supplement (8026809).

#### 8.1.2 Events

In addition to the **device status**, the IO-Link interface offers events for error diagnosis. Detailed information can be found in the IO-Link supplement. The following information is available as events:

Table 26: Events available

| Code dex (hex) Event name |                                   | Туре    |
|---------------------------|-----------------------------------|---------|
| 20480 (0x5000)            | Device hardware fault             | Error   |
| 30480 (0x7710)            | short-circuit                     | Error   |
| 36004 (0x8CA4)            | Quality of run alarm              | Warning |
| 36007 (0x8CA7)            | Teach-in error                    | Warning |
| 36008 (0x8CA8)            | Alarm upper temperature threshold | Warning |
| 36011 (0x8CAB)            | Alarm operating hours             | Warning |
| 36015 (0x8CAF)            | Alarm lower temperature threshold | Warning |
| 36017 (0x8CB1)            | Teach-in necessary                | Note    |
| 36033 (0x8CC1)            | Sync error                        | Warning |

### 8.1.3 Detailed Device Status

The **Detailed Device Status** is a list of currently pending events. The list represents 8 events (maximum number of SLG-2 events). Each entry has a length of 3 bytes or 3 octets and contains information about the event type (obtained via the **Event Qualifier**) as well as about the **Event Code**. The last event that occurred is always at index 1 (dynamic list).

Table 27: IO-Link index of the Detailed Device Status

| IO-Link Index | Object name            | Description                    |  |
|---------------|------------------------|--------------------------------|--|
| 37            | Detailed device status | List of current IO-Link events |  |

| Subin-<br>dex | Object name     | Data type | Description                               |
|---------------|-----------------|-----------|---|
| 1             | Error_Warning_1 | 3 octets  | All octets 0x00:                          |
| 2             | Error_Warning_2 | 3 octets  | No Error/Warning Octet 1: Event Qualifier |
| 3             | Error_Warning_3 | 3 octets  | Octet 2, 3: Event Code                    |
| 4             | Error_Warning_4 | 3 octets  |   |
|               |                 |           |   |
| n             | Error_Warning_n | 3 octets  |   |

The following states are available as event qualifiers:

Table 29: Event Qualifier

| Event Qualifier   | am       | dec | hex |
|-------------------|----------|-----|-----|
| Warning disappear | 10100100 | 164 | A4  |
| Error disappear   | 10110100 | 180 | B4  |
| Warning appear    | 11100100 | 228 | E4  |
| Error appear      | 11110100 | 244 | F4  |

## 8.2 Device-specific diagnostic information

In addition to the IO-Link-specific diagnostic information, additional diagnostic information about the process or service data can be transmitted via the **System status** as well as limited via pin 2 with the **Masked system status output** option. In addition, SOPAS ET offers a user-friendly display of this diagnostic information.

Figure 35: System status in SOPAS

The system status contains device-specific diagnostic information and has a length of one byte. Each bit represents different diagnostic information.

Table 30: IO-Link index of device-specific diagnostic information

| IO-Link Index | Object name   | Description   |
|---------------|---------------|---|
| 100           | System status | Device-specific diagnostic infor-<br>mation transmittable via the<br>process data |

| Table 31: Bits of the device-specific diagnostic information | n |
|--|---|
|--|---|

| Bit number | System status                        | Туре                                      |
|------------|--------------------------------------|---|
| Bit O      | Pin short circuit error              | Error                                     |
| Bit 1      | Invalid process data                 | Error                                     |
| Bit 2      | Temperature or operating hours alarm | Warning                                   |
| Bit 3      | Busy                                 | Note                                      |
| Bit 4      | Quality of run alarm                 | Warning                                   |
| Bit 5      | Hardware error                       | Error                                     |
| Bit 6      | Teach-in error                       | Error<br>(a warning in IO-Link<br>Events) |
| Bit 7      | Sync error                           | Error<br>(a warning in IO-Link<br>Events) |

The system status can be transmitted cyclically via the process data. Configuration of the process data is described in section 7.8.

In addition, the **System status** information can also be transmitted as a 1-bit value "OR" function via pin 2 / MF. A selection of diagnostic information relevant for the application is possible here (see "Diagnostic settings", page 45).

# 8.3 Diagnostic information via the display LEDs

Three different diagnostic classes are available as diagnostic information via the display: Table 32: Diagnostic classes and display behavior

| Diagnostic class | LED  |
|------------------|------|
| About            | 1 Hz |
| Warning          | 2 Hz |
| Error            | 8 Hz |

The states are represented as follows:

#### 

All messages are relevant only to the recipient, with the exception of **Test input enable**, **Power on** and **Hardware error**.

| Message                                   | Details   | Class        | Yellow LED   | Green LED                |
|---|---|--------------|--|--------------------------|
| Power on                                  | -   | About        | Not relevant   | On                       |
| Presence/no presence                      | Independent of the pin configu-<br>ration   | About        | Off ≥ 1<br>beam inter-<br>rupted<br>On = no<br>beam inter-<br>rupted | On                       |
| Busy                                      | Device startup, Teach-in, Fac-<br>tory reset, Reconfiguration cross<br>beam, IO-Link data storage<br>download | About        | 1 Hz; 50%<br>duty  | On                       |
| Find me                                   | In the FindMe function, both<br>LEDs on the receiver flash.   | About        | 1 Hz; 50%<br>duty  | 1 Hz; 50%<br>duty        |
| IO-Link communica-<br>tion                | -   | About        | Not relevant   | 1 Hz; 90%<br>on; 10% off |
| Test input enable                         | If a HIGH signal is applied to sender pin 2, the sender LEDs are deactivated (sender only).                   | About        | 1 Hz; 50%<br>duty  | On                       |
| Quality of run (QoR)<br>alarm warning     | LED only flashes if no object is in the beam path   | Warn-<br>ing | 2 Hz; 50%<br>duty  | On                       |
| Temperature or oper-<br>ating hours alarm | -   | Warn-<br>ing | 2 Hz; 50%<br>duty  | On                       |
| Alignment aid                             | If alignment aid is activated via index 69 or SOPAS.  | Warn-<br>ing | 2 Hz; 50%<br>duty  | On                       |
| Teach-in error                            | 5 seconds active. After a power cycle, a Teach-in error becomes a Teach-in necessary                          | Error        | 8 Hz; 50%<br>duty  | On                       |
| Short circuit error                       | -   | Error        | 8 Hz; 50%<br>duty  | On                       |
| Sync error                                | If first and last beam interrupted at the same time   | Error        | 8 Hz; 50%<br>duty  | On                       |
| Hardware error                            | -   | Error        | Off  | Off                      |

Table 33: LED display depending on device status

## 8.4 Sync error

To ensure reliable detection with the specified resolution, only one beam at a time is active on the light grid. The beams are clocked through in the  $\mu$ s range.

To ensure that the sender beam and the receiver beam adjacent on the same plane are always active, the beams must be synchronized with each other.

With the SLG-2 light grid, this happens optically via beam 1 and the last beam (starting from the cable). If both synchronization beams are interrupted at the same time, a **Sync error** is displayed as the diagnosis. In this state, the SLG-2 light grid can perform detection, but it can no longer detect which beams are interrupted.

In this mode, object measurement (**Beam status**, height, width...) is no longer possible. For measuring tasks, it must therefore be ensured that one of the two sync beams is free during the measurement process.

# 8.5 Troubleshooting

| LED indicator/fault pattern  | Cause  | Measure   |
|--|--|---|
| Yellow LED does not light up,<br>no object in the path of the<br>beam                                | Distance between sender and<br>receiver is too large:<br>Sender and receiver not<br>aligned correctly. | Check application.<br>Align the sender with the<br>receiver and teach in.<br>Alignment aid is available,<br>section 7.5.1.      |
| Yellow LED lights up, although<br>an object is in the path of the<br>beam.                           | Object too small or is reflected<br>and diverted away or is trans-<br>lucent.                          | Check application, opaque<br>object?<br>Where applicable, remove the<br>cause of the reflection<br>Start teach-in process again |
| Yellow LED flashes at 8 Hz for $\leq 5$ s.   | Teach-in faulty  | Check application<br>Align the sender with the<br>receiver and teach in.  |
| Yellow LED flashes at 8 Hz for<br>as long as an object is located<br>in the optical path.            | Object is blocking all beams.  | Ensure that the last or first<br>beam is always unobstructed<br>(this is only relevant for meas-<br>uring applications).        |
| Yellow LED flashes at 2 Hz for<br>as long as no object is located<br>in the optical path.            | Device is dirty or poorly aligned.   | Clean sender and receiver with<br>plastic cleaner and/or align.<br>Start teach-in process again                                 |
| Yellow LED flashes at an<br>undefined frequency even<br>though an object is in the opti-<br>cal path | Interference with an adjacent sensor   | Swap the arrangement of the<br>sender and receiver<br>Start teach-in process again  |
| Yellow LED flashes at 8 Hz for<br>> 5 s, no object in the beam<br>path                               |  | Check cabling (short circuit).  |
| Both LEDs do not light up.   | No voltage supply  | Perform a <b>Power cycle</b> .<br>If the error is still present, con-<br>tact customer service.                                 |

# 9 Maintenance

# 9.1 Maintenance

During operation, the device works maintenance-free.

Depending on the assignment location, the following preventive maintenance tasks may be required for the device at regular intervals:

Table 34: Maintenance schedule

| Maintenance work                            | Interval   | Implementation |
|---|--|----------------|
| Clean housing and front screen              | Cleaning interval depends on ambi-<br>ent conditions and climate | Specialist     |
| Check screw connections and plug connectors | Every 6 months   | Specialist     |

# 10 Decommissioning

## **10.1** Disassembly and disposal

#### Disassembling the device

- 1. Switch off the supply voltage to the device.
- 2. Detach all connecting cables from the device.
- 3. If the device is being replaced, mark its position and alignment on the bracket or surroundings.
- 4. Detach the device from the bracket.

### Disposing of the device

Any device which can no longer be used must be disposed off in an environmentally friendly manner in accordance with the applicable country-specific waste disposal regulations.

# **NOTE**

Disposal of batteries, electric and electronic devices

- According to international directives, batteries, accumulators and electrical or electronic devices must not be disposed of in general waste.
- The owner is obliged by law to return this devices at the end of their life to the respective public collection points.

This symbol on the product, its package or in this document, indicates that a product is subject to these regulations.

# 10.2 Returning devices

Do not dispatch devices to the SICK Service department without consultation.

# i NOTE

<sup>7</sup> To enable efficient processing and allow us to determine the cause quickly, please include the following when making a return:

- Details of the contact person
- Description of the application
- Description of the fault that occurred

# **11** Technical data

# 11.1 Resolution

To determine the resolution, 3 essential parameters have to be distinguished:

MDO: Minimum detectable object = minimum object size

MOL: Minimum object length

MOW: Minimum object width (only relevant in cross-beam mode)

The minimum object size differs between parallel-beam mode and cross-beam mode.

Description, section 3.3.4.

## **11.1.1** Minimum detectable object (MDO)

#### **Parallel operation**

Table 42: MDO in parallel-beam mode

| Beam separation | Minimum detectable object (MDO) |
|-----------------|---------------------------------|
| 10 mm           | 15 mm                           |
| 25 mm           | 30 mm                           |
| 50 mm           | 55 mm                           |

#### Cross-beam mode

A description of cross-beam mode can be found in section 3.3.4.

In cross-beam mode, the MDO depends on the beam separation, the cross-beam option and the object position between the sender and receiver. The following graphic serves for a better understanding:

Figure 36: MDO: Example of a light grid with 10-mm beam separation and the set 9x cross-beam option

For the 9x cross-beam option, the MDO for a device with 10-mm beam separation is equal to 8 mm in the MDO3 range and 6.5 mm in the MDO2 and MDO4 ranges. In the MDO1 and MDO5 range, the MDO is 15 mm, as in parallel-beam operation.

It should be noted that the 9x intersection is achieved only in the middle region of the vertical light grid length (from beam 4 to beam N-3). After that, the cross-beam option decreases by one option per beam.

The MDOx ranges are relative indications. In this example, if the light grid has a working distance of 1,000 mm, the MDO3 range is 120 mm and MDO2 and MDO4 ranges are 330 mm each. If the light grids are spaced twice, the MDOx range is also doubled.

The higher the set cross-beam option, the greater the range of better resolution due to crossed beams between the sender and receiver (MDO2 – MDO4). The table below contains the MDO data depending on the set cross-beam option and the beam separation of each individual range.

| Beam separation  | Зх  | 5x   | 7x   | 9x   |
|--|---|--|--|--|

Table 43: MDO depending on the beam separation, the cross-beam setting as well as the position of the object

Figure 37: Example MDO 3x cross beam and 10 mm beam separation

Figure 38: Example MDO 9x cross beam and 10 mm beam separation

## 11.1.2 Minimum object length (MOL)

Description, section 3.3.4.

Minimum object length of static object: MOL = 3 mm Minimum object length of moving object: MOL = object speed (mm/ms) x minimum dwell time (ms) + 3 mm

The formula for calculating the minimum dwell time can be found in section under Characteristics.

#### 11.1.3 Minimum object width (MOW)

Description, see "Beam separation, minimum object size, minimum object width and minimum object length", page 16.

Beam crossing allows flat (infinitely thin) objects to be detected if they have a certain minimum object width (MOW = minimum object width). The detection depends on the object position and on the set cross-beam option. The following graphic serves for a better understanding:

Figure 39: MOW: Example of a light grid with 10 mm beam separation and the set 9x cross-beam option

For the 9x cross-beam option of a device with 10 mm beam separation, the minimum object width MOW is 26% of the sensing range in the MOW2 range. If the sensing range is, for example, 1,000 mm, the infinitely thin object must be at least 260 mm wide in order to be reliably detected in the MOW2 range. The table below contains the MOW data depending on the set cross-beam option and the beam separation of each range.

| Beam sepa-<br>ration | Parallel opera-<br>tion        | Зх                             | 5x   | 7x  | 9x   |
